Student-Volunteer History and Tracking System is based on idea of Journey Mapping

We should use this process
to outline the GOALS AND
Action Steps of the tech
Plan — SVHATS is just one piece.

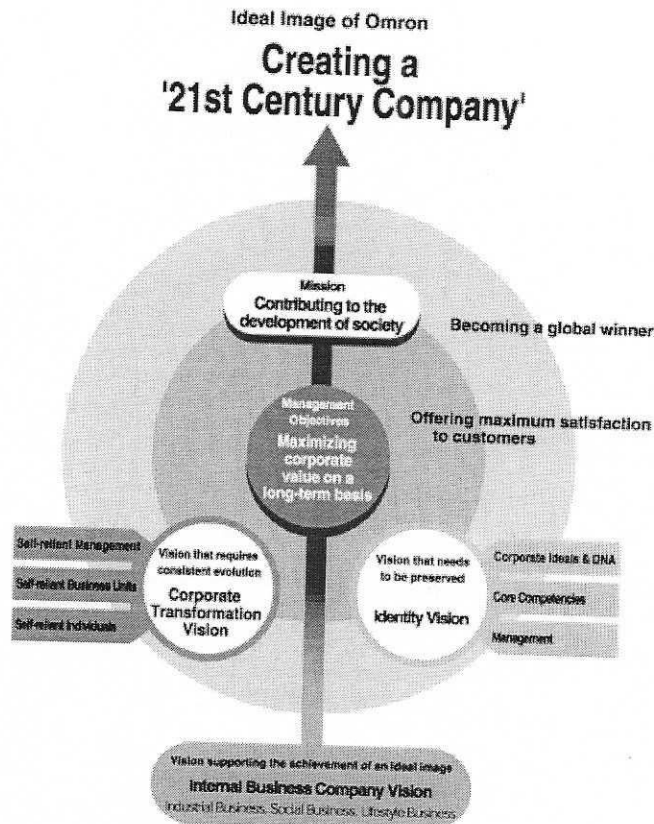

What is Journey Mapping?

Journey Mapping is a 'Graphic Language' used to illustrate the answers to fundamental questions¹:

1. Where have we been?
2. Where are we now?
3. Why are we here?
4. Where do we want to be?
5. How do we get there?

Journey mapping can be used to plan or track changes.

Planning. Journey Maps are usually used by project professionals akin to a road map, as a tool to visualize their journey. Journey Mapping enables the team to determine the most suitable and successful ways to meet their objectives. It also serves as a constant unspoken reminder of an Organization's (School's) ethos, history, current context and future objectives.

Tracking. Customer Journey Mapping² is a tool for visualizing how customers interact with people and organizations in order to make a purchase or receive a service.

It comes from the corporate sector and market research. It can be used as a form of consultation to improve a service through finding out how people use the service and how they interact with the service provider. It provides a map of the interactions and emotions that take place, and can help an organization provide its customers with a desired experience. Two examples of Customers Journey Mappings can be found below:

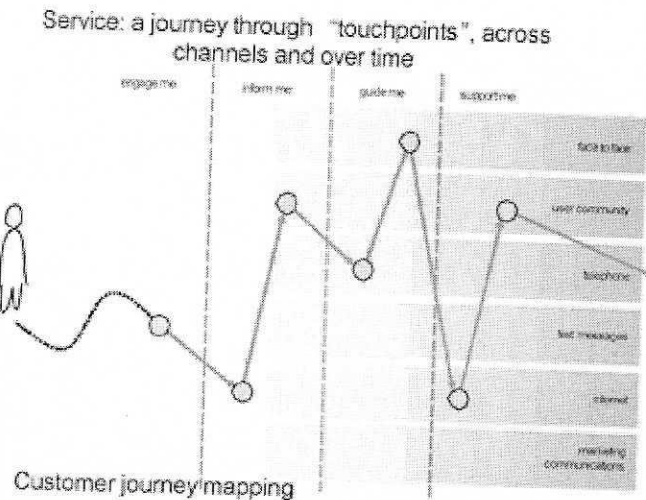

Concept MAPS

*They use term different than
we do*

Education & Journey Maps

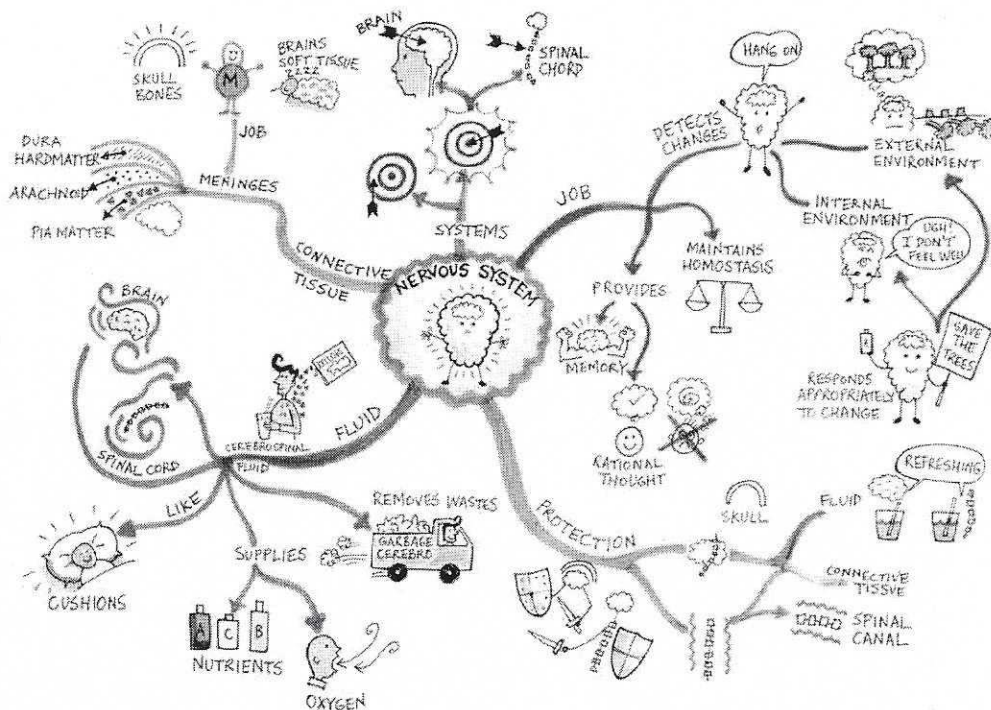

Journey mapping in an educational environment is used to plan projects/research, education (behavioral change of participant) or to track what has been done (tracking and remembering). Therefore, Instructional Designers make maps of courses they work on students produce maps of subject matter that illustrate connections between each subject area and teachers make maps of their courses. In all the aforementioned situations Journey maps are very helpful.

Characteristics of Journey Maps

As you can see, we have numerous examples of maps that are used for planning and tracking progress towards a goal. What do they have common?

They are:

1. **Used by people that made them.** Sometimes help of teacher or an external consultant is needed to make proper map – but they are always used by people who made them.
2. **Maps/graphic.** Visual component increase understanding (the big picture) and retaining (People retain 80% of what they see and only 15% of auditory concepts) and communication (better for team work).
3. **Focused on objectives.** Maps are showing a way how to achieve the desired objective faster/easier/cheaper. In the 'planning' situation we are thinking about how to get there, and in the 'tracking' situation we are looking at how to get there faster/better/cheaper the next time around. It is important to notice that in both situations we have well-defined objectives.

Characteristics of SVHATS?

OK, now we know what the characteristics of the Journey Maps are. Let's go step back and find which of those features the SVHATS has.

1. SVHATS do not have any graphic/map feature.
2. People that are entering data are not using the data.
3. Objectives users (students/volunteers) should achieve are not defined.

According mentioned data, we can conclude that SVHATS do not have any important Journey Mapping features.

What is SVHATS then?

SVHATS is a report system.

Do we need a reporting system?

Maybe... But let's see what the reporting systems are for? And how can we use them?

Professor Peter Drucker describes reports like:

Reports and procedures are necessary tools. But few tools can be so easily misused, and few can do so much damage. For reports and procedures, when misused, cease to be tools and become malignant monsters.

In his book, *The Essential Drucker* (page 123), professor Drucker describe three common misuses of reports and procedures. So, let's see, do we have some of these problems here at Cabrini Connections?

Peter Drucker's description	Our example
Right conduct? <i>The first is the all too common belief that procedures are instruments of morality. They are not; their principle is exclusively that of economy. Procedures never direct what should be done, only how it might be done most expeditiously. ... right conduct can never be established by procedure.</i>	Journey Maps enable a team/student to navigate the most suitable and successful ways to meet their objectives. Therefore, a prerequisite for a good Journey Map is to have a particular objective. Unfortunately, we do not have defined objectives and SVHATS as a reporting system cannot be used to define the proper objective. Furthermore, there are attempts to use data generated by the SVHATS as proof that we are doing the 'right thing'. Estimated malignancy potential: high
Substitute for judgment. <i>The second misuse is to consider procedures a substitute for judgment. Procedures can work only where judgment is no longer required. ... Our civilization suffers from a superstitions belief in the magical effect of printed (and digital) forms. And the superstition is most dangerous when it leads us into trying to handle the exceptional, not routine situation by procedure.</i>	Procedures are a substitute for neither judgment nor education. Procedures can work only where judgment or education is no longer required. Each student's career path is an 'exceptional, not routine situation' and it can not be handled by procedures. Estimated malignancy potential: medium-high
Instrument of control from above. <i>But the most common misuse of reports and procedures is as an instrument of control from above. ... The common case of the plant manager who has to fill out twenty forms to supply accountants, engineers or staff people in the central office with information he himself does not need, is one of thousands examples. As a result, the man's attention is directed away from his own job. The things he is asked about or required to do for control purposes come to appear to him as reflections of what the company want of him, he tends to put effort into those things rather than into his own job. Eventually, his boss, too, is misdirected, if not hypnotized, by the procedure.</i> <i>...For the managers in the field spend more and more time filing our reports, less and less doing their work. Worse still, they soon learned to subordinate performance to a "good showing".</i> <i>Not only did performance go to pieces, morale suffered even more. Top management and its staff experts come to be viewed as by the field managers as enemies to be outsmarted or at least kept as far as possible.</i>	The common case of the <u>student who has to fill out two forms each time she come to Cabrini Connections</u> is one obvious example. As a result, the student's attention is directed away from his own development. The things he is asked about or required to do for control purposes come to appear to him as reflections of what the organization want of him, he tends to put effort into those things rather than into his own education. Eventually, his mentor, too, is misdirected, if not hypnotized, by the procedure. Worse still, they soon learned to subordinate performance to a "good showing". EXAMPLE is a student who is submitting each time the same comment: 'Homework'. Estimated malignancy potential: high

Conclusion/diagnosis

Data suggest that all 'three common misuses of reports and procedures' are in significant level affecting Cabrini Connections throughout the SVHATS system.

Therapy. *Every business should regularly find out whether it needs all the reports and procedures it uses. At least once every five years, every form should be put on trial for its life. I once had to recommended an even more drastic measure to clear up a situation in which reports and forms, luxuriating like the Amazon rain forest, treated to choke the life out of an old established utility company. I suggested that all reports be suspended simultaneously for two months, and only those be allowed to return that managers still demanded after living without them.*

To "control" everything is to control nothing. *Reports and procedures should focus only on the performance needed to achieve results in key areas. To "control" everything is to control nothing. An attempt to control the irrelevant always misdirect.*

HOW TO DO IT? *Reports and procedures should be a tool of the man who fills them out. They must never become the measure of her performance. A man must never be judged by the quality of the production form he fills out – unless he be the clerk in charge of those forms. He must always be judged by his production performance. And the only way to make sure of this is by having him fill out no forms, make no reports, expect those he needs himself to achieve performance.*

Annex

Why did it happen and why didn't we notice it before?

Elements 3, 4 and 5 of the successful decision making process were not followed (as described below).

The decision-making process

The elements of an effective decision-making process are (Vail and Sloan, 1922 / page 242) are:

- 1. The clear realization that the problem was generic and could only be solved through a decision that established a role, a principle*
- 2. The definition of the specifications that answer to the problem had to satisfy, that is, of the "boundary conditions"*
- 3. The thinking through what is "right", that is, the solution that will fully satisfy the specifications before attention is given to the compromises, adaptations, and concessions needed to make the decision acceptable*
- 4. The building into the decision of the action to carry it out*
- 5. The "feedback" that test the validity and effectiveness of the decision against the actual course of events.*
